PRODUCT

Laminated Glass : Lamisafe

Glass consists of three layers (glass + film PVB + Glass). The strength of laminated glass lies on the film named PVB (Polyvinyl butyral film). This film is very strong and tough.

Tempered Glass : Temperlite and Zonelite

Temperlite is hardened glass by heating process until about 650 C and cooling suddenly. If it is broken the glass will shatter into small fragmentation glass. It is used on glass doors, side glass and rear glass.

Zonelite is tempered glass which has special zone at middle area of glass. If it is broken this area will have bigger fragmentation glass for the driver to see the street through the glass. It is used only for windshield

Logo

Standard Quality

Asahimas has already been listed as a company who fulfil the Internasional quality standard :

Standard Quality Product

- JIS (Japan Industrial Standard)
- AS (American Standard)
- ECE E6 43R (European Standard)
- SNI (Standard National Indonesia)
- PNS (Philippines National Standard)
- CCC (China Compulsory Product Certification)

Standard Quality Management

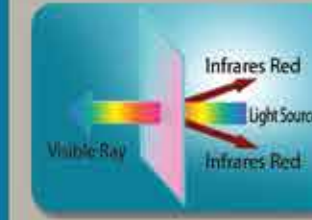

- ISO 14001 -2004 (Environment management system)
- ISO T/S 16949-2004 (Quality management system)
- ISO 17025 -2006 (Laboratory accreditation)
- OHSAS 18001 -2008 (Health safety environment management system)

FEATURE PRODUCT

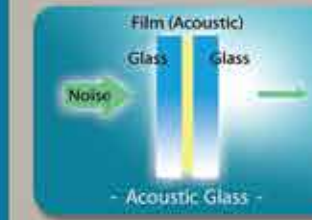

MSW (Melting Snow Windshield)

In the inside surface of the laminated glass, between the glass and PVB, heating conductor will be printed at the top and bottom side of the glass. The glass is used in the countries who have snow season. It will melt the snow on the windshield surface.

IR Cut Windshield

The windshield use special PVB film which can reduce infra red ray from the sun. It means also reducing the temperature inside the car and gasoline consumption due to low of Air Conditioning work.

Acoustic Windshield

By using special PVB film, the noise coming through the windows is reduced. The driver will feel comfortable silent cabin environment.

MAW (Module Assembly Window)

Implemented on the front ventilation glass, a small glass in front of the front door. The glass will have molding which injected directly to the glass. This design will enhance the cars appearance and guarantee no leakage into the car.

Defogger

Implemented on the rear glass by printing conductor line using silver paste on the glass surface. Used to remove the moisture on the glass surface due to outside car temperature is cooler than inside car.

Antenna

The glass surface is printed with conductor line using silver paste with a special pattern. The conductor line act as antenna for receiving radio signals to audio player in the car. It will add aesthetic value of the car. This antenna can be implemented on the rear glass and side window glass.
